

PLI

Ceiling diffuser

Overview

Description

The PLI is a square ceiling-mounted supply air diffuser designed for flush installation in modular false ceiling systems. It is intended for use in offices, schools, healthcare facilities, and other similar indoor environments where both discreet appearance and reliable performance are required. The diffuser features a circular front slot in combination with an aerodynamically shaped back connection section, enabling smooth 360-degree horizontal airflow. This design promotes even air distribution and efficient mixing with the room air. The airflow adheres to the ceiling surface (through the Coandă effect), reducing the risk of draughts in the occupied zone, even at lower airflows or when supplying cooler air. The PLI maintains a uniform visible design regardless of spigot size and is suitable for both supply and extract air, without requiring modification. This ensures a consistent appearance across different areas of a building. The diffuser is connected to a TLM or TK commissioning box, which includes sound-absorbing insulation, an air deflector plate, and an integrated damper module with measuring tubes and cords for proper airflow adjustment. The PLI can handle temperature differences of up to 12 °C below room temperature, making it suitable for cooling applications while maintaining thermal comfort and air quality.

Optional accessories

- TLM:** A compact commissioning box for airflow regulation with supply air diffusers, featuring environment friendly sound absorbent insulation, an air distribution plate and a damper module. The product is designed for ceiling installation and ideal for flush mounting in suspended (false) ceilings.
- TK:** A commissioning box, featuring low build height, environmentally friendly sound-absorbent insulation, a supply air distribution plate, and a removable damper module for commissioning and measuring airflow. The sound insulation offers optimal noise attenuation, ensuring quiet operation to enhance comfort in various settings. The damper module is equipped with a measurement flange and hoses for precise airflow measurement, and the damper blade is fitted with adjustment cords for easier commissioning and securing the airflow. The low height is possible by the internal socket design of the diffuser connection, minimising the total height of the diffuser and box, when assembled together.
- MN:** Sleeve/nipple for installation with a pressure box in suspended ceilings. The accessory adds 40 mm to the installation height.

Table 01 - Quick selection TLM

Size [mm]	PLI	TLM	Airflow [l/s] [m³/h] at different sound pressures*			
			25 [dB(A)]		30 [dB(A)]	
			Supply air	Exhaust air	Supply air	Exhaust air
160	160-160	58 [209]	73 [263]	67 [241]	89 [320]	
200	200-200	75 [270]	94 [338]	86 [310]	113 [407]	
250	250-250	126 [454]	132 [475]	149 [536]	157 [565]	

*The given data are valid for a fully open damper.

Main characteristics

- Square ceiling diffuser for supply or extract air
- Designed for flush mounting in suspended ceiling systems
- Circular slot opening for a 360 degree air distribution
- Optimal Coandă effect at higher temperature differences and lower airflows
- High induction with quick mixing of supply air
- Low noise level
- Recommended to use with TLM or TK commissioning boxes

Applications

The PLI diffuser is ideal for ventilating spaces where discreet and efficient air distribution is required, such as offices, schools, hospitals, restaurant and retail stores. It is effective for both supply and extract air, making it versatile for various building types.

Materials and finish

The front diffuser plate is made of galvanized steel, the back section is made of sheet steel. The unit is powder coated in standard RAL 9003 white color. The air connection features an EPDM sealing.

Table 02 - Quick selection TK

Size [mm]	PLI	TK	Airflow [l/s] [m³/h] at different sound pressures*			
			25 [dB(A)]		30 [dB(A)]	
					[l/s]	[m³/h]
160	160-100	41	148	48	173	
		55	198	65	234	
200	200-125	62	223	73	263	
		80	288	92	331	
250	250-160	91	328	105	378	
		100	360	114	410	

*The given data are valid for a fully open damper.

Installation

- The air diffuser is designed for installation in conventional laying-in type modular ceiling systems (standard T-grid T14/24).
- The front plate of the air diffuser is mounted using spacer legs that ensure it is always horizontal.
- The design allows for easy disassembly of the front plate and damper without tools for maintenance, such as cleaning the duct system.
- The spigot between the diffuser and the pressure distribution box can be extended with a circular duct. If the spigot exceeds 500 mm, extension of the measuring tube and damper cords is required.
- The spigot of the commissioning box is connected to the circular duct. The air diffuser is connected to the outlet spigot of the commissioning box. Connection to a straight-mounted flexible hose is possible but not recommended.
- The TK and TLM commissioning boxes can be installed directly after a bend. If installed after a T-joint, a straight section corresponding to 3x the diameter is required.
- For extra safety, the product is delivered with a safety cord attached to the front plate. During installation, the cord is secured with a simple loop on one of the spacers.

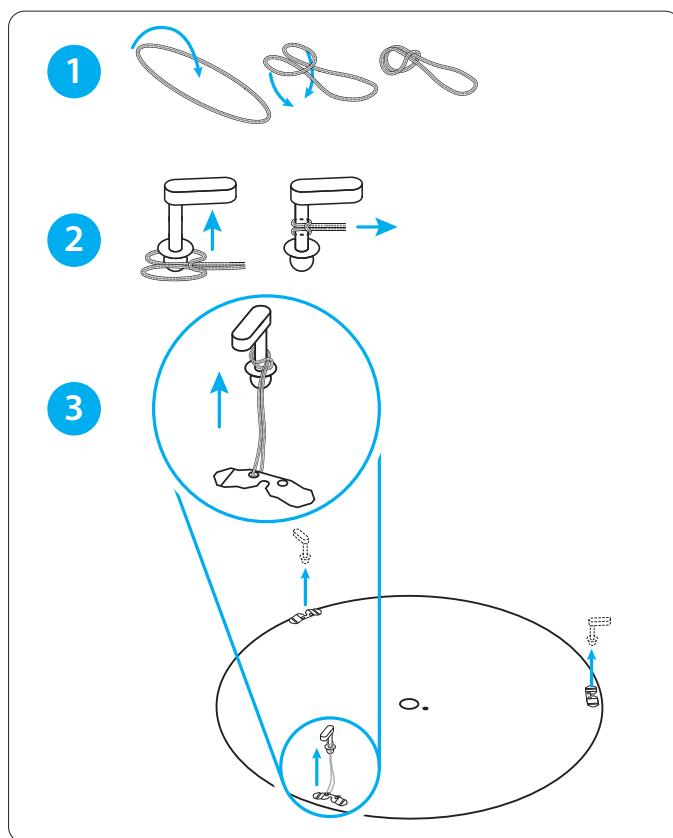

Figure 01 - The diffuser front plate is secured with the included safety cord attached through a simple loop on one of the spacer legs.

Dimensioning

Sound data

For the reported sound data:

- Sound pressure level, L_{PA} dB(A), is read from the Dimensioning Diagram where P_t (Pa) is total pressure and q (l/s or m^3/h) is airflow.
- The designation of the commissioning box refers to the box's connection dimensions (mm), for example TK-160-100:
- Outlet Ø160 (towards diffuser) - Inlet Ø100 (towards duct).

The terms 1-step and 2-step refer to the relationship between the commissioning box's connection dimensions:

- 1-step implies a one-step dimension change from inlet to outlet.
- 2-step implies a two-step dimension change from inlet to outlet.
- Self-attenuation applies to diffusers with pressure box including outlet attenuation. (See: Table 03)
- Correction factor, KOK [dB] for each octave band, is obtained from Table 04: Correction KOK [dB].
- Sound pressure level, LPA [dB], is calculated as $LW = LPA + KOK$
- Measurements have been performed according to ISO 9614-2 and ISO 11691:1995.

Dimensioning diagram

For all dimensioning diagrams, the following applies:

- Correction of dB(A) value is performed depending on the pressure drop across the balancing damper, see Correction table - dB(A).
- For products with built-in dampers or products reported including a pressure box, 0% = closed damper, 100% = open damper.
- Sound pressure level, LPA dB(A), in dimensioning diagrams corresponds to the A-weighted sound level in the reverberation field at $10 m^2$ equivalent sound absorption area. This corresponds to 4 dB room attenuation in a normally damped room with $25 m^3$ room volume.
- ▼ = min. flow to obtain recommended measuring pressure.
- Throw length, $L_{0,2}$, indicates the distance from the air diffuser where the air velocity has decreased to 0.2 m/s, valid for isothermal supply at ceiling.
